Trusses

#1616XVT-2000

One of the key factors to build a seamless LED display is the way it is supported. The ideal structure has a low deflection rate, assembles quickly, and ensures a safe installation. Our custom-designed 16 x 16” channel truss does all three. All rigging components are stress-tested in a state-of-the-art engineering facility and certified with strict industry regulations to meet or exceed widely accepted safety factors. The high number of cross braces makes cable management easy without the need for electrical tape or knots. By using a clever system with built-in adjustable rigging points, the xVision Channel Truss eliminates the need for extra shackles, steel slings, and span sets, all of which eats up usable height and installation time. The adjustment mechanism allows for precise alignment of the LED display by tweaking the vertical position of each bumper, which can also ride inside the truss for an even quicker installation time.
